

Assessment of Post-Fire Rehabilitation of Desert Tortoise Habitat in Clark County: Project 2009-USGS-808A

**Lesley DeFalco and Sara Scoles-Sciulla
USGS, Western Ecological Research Center
Henderson, Nevada**

**In collaboration with
Scott Abella and Cayenne Engel
University of Nevada, Las Vegas**

2011 MSHCP Project Progress Report Symposium

August 17, 2011

Overview

- Historical background of project
- Project goals and approach
- Progress to date

Background of Problem

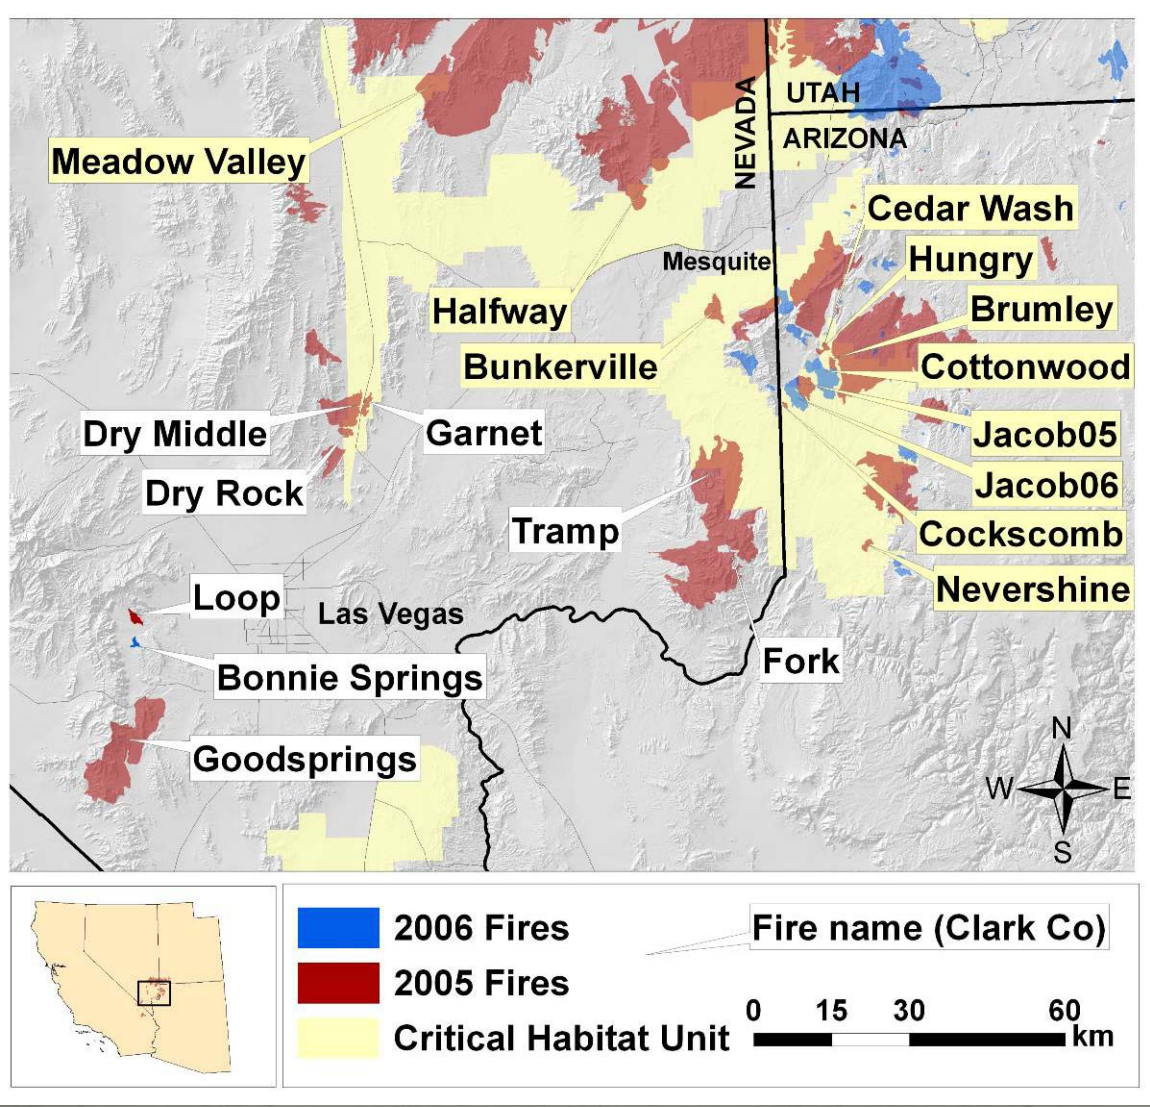

- Mojave fires have increased in frequency and size (Brooks & Matchett 2006)
- Resprouting of native shrubs is limited (DeFalco et al. 2010)
- Little is known about recovery and rehabilitation of burned desert shrublands (Abella and Newton 2009)

- Fires alter habitat for sensitive wildlife species (Esque et al. 2003)

Wildfire Reduces Canopy Cover and Forage for Desert Tortoises

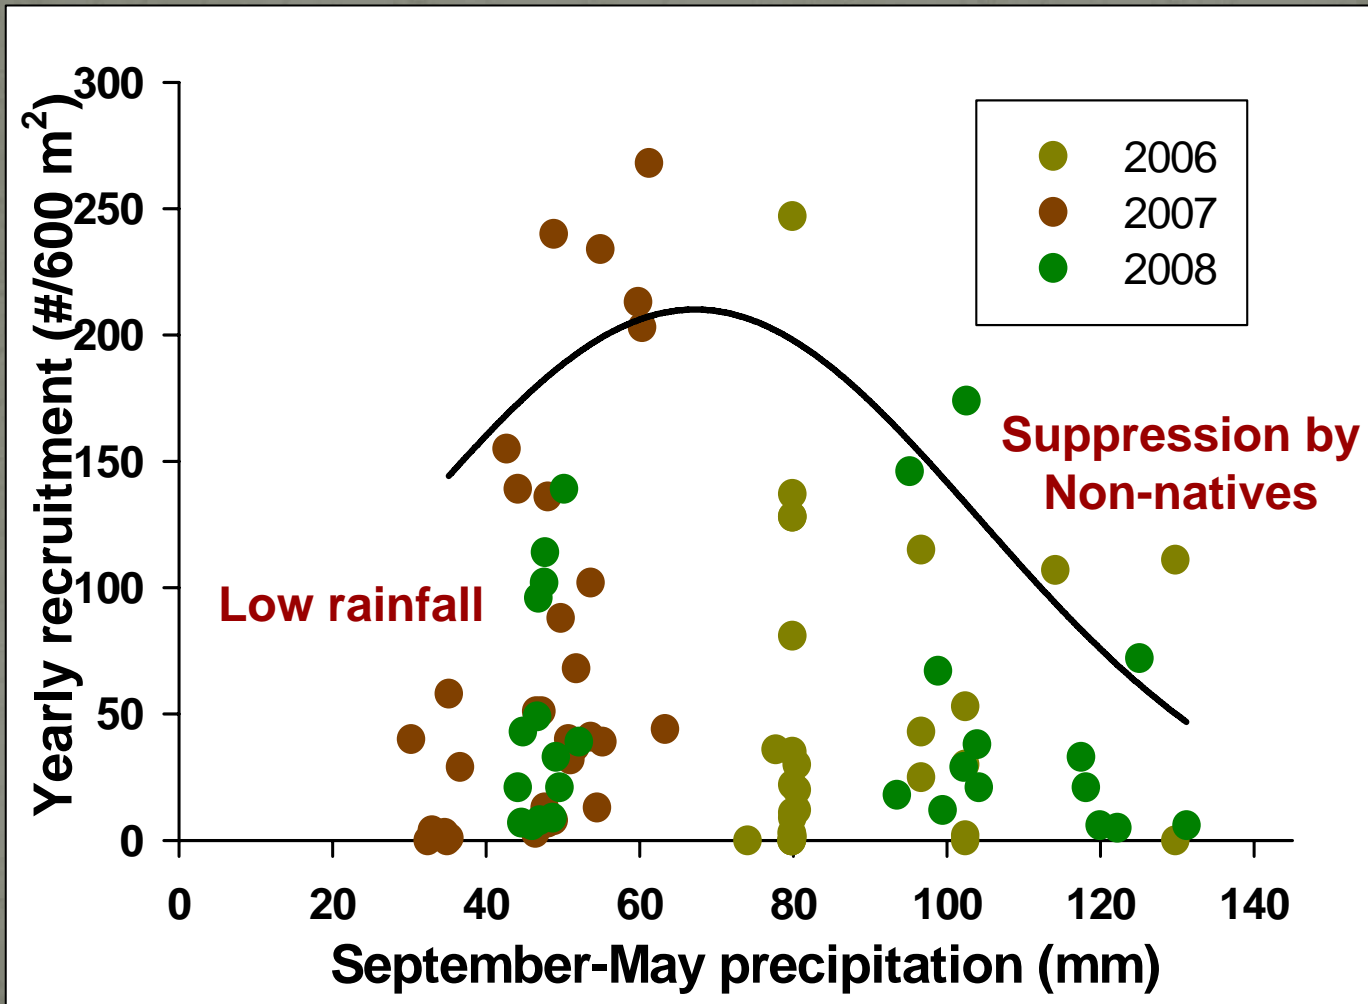

Nevada (11 fires)

- BLM ES&R (34%)
- CC DCP (21%)
- USGS (10%)

Arizona (8 fires)

- BLM ES&R (20%)
- BLM, Arizona Strip (15%)

Potential Limitations to Perennial Plant Establishment

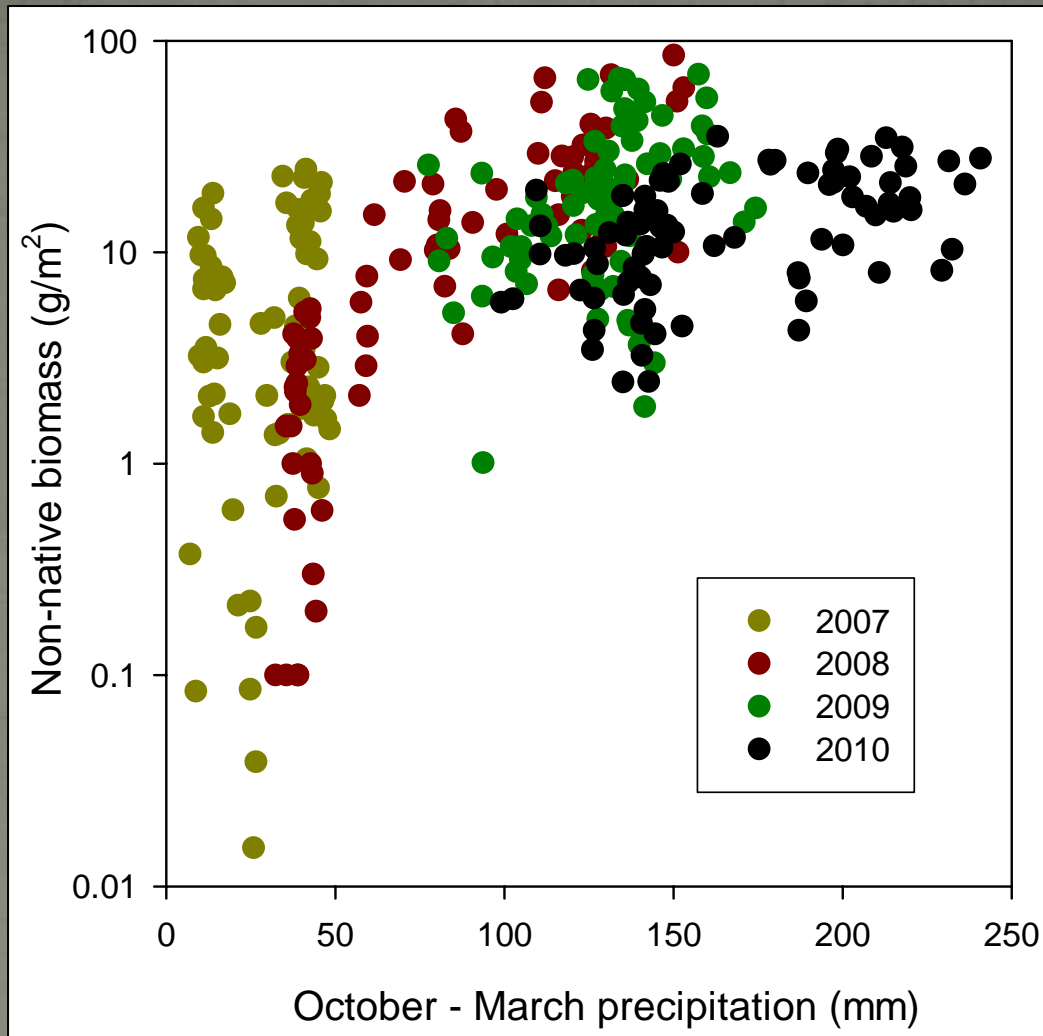

Project Goals

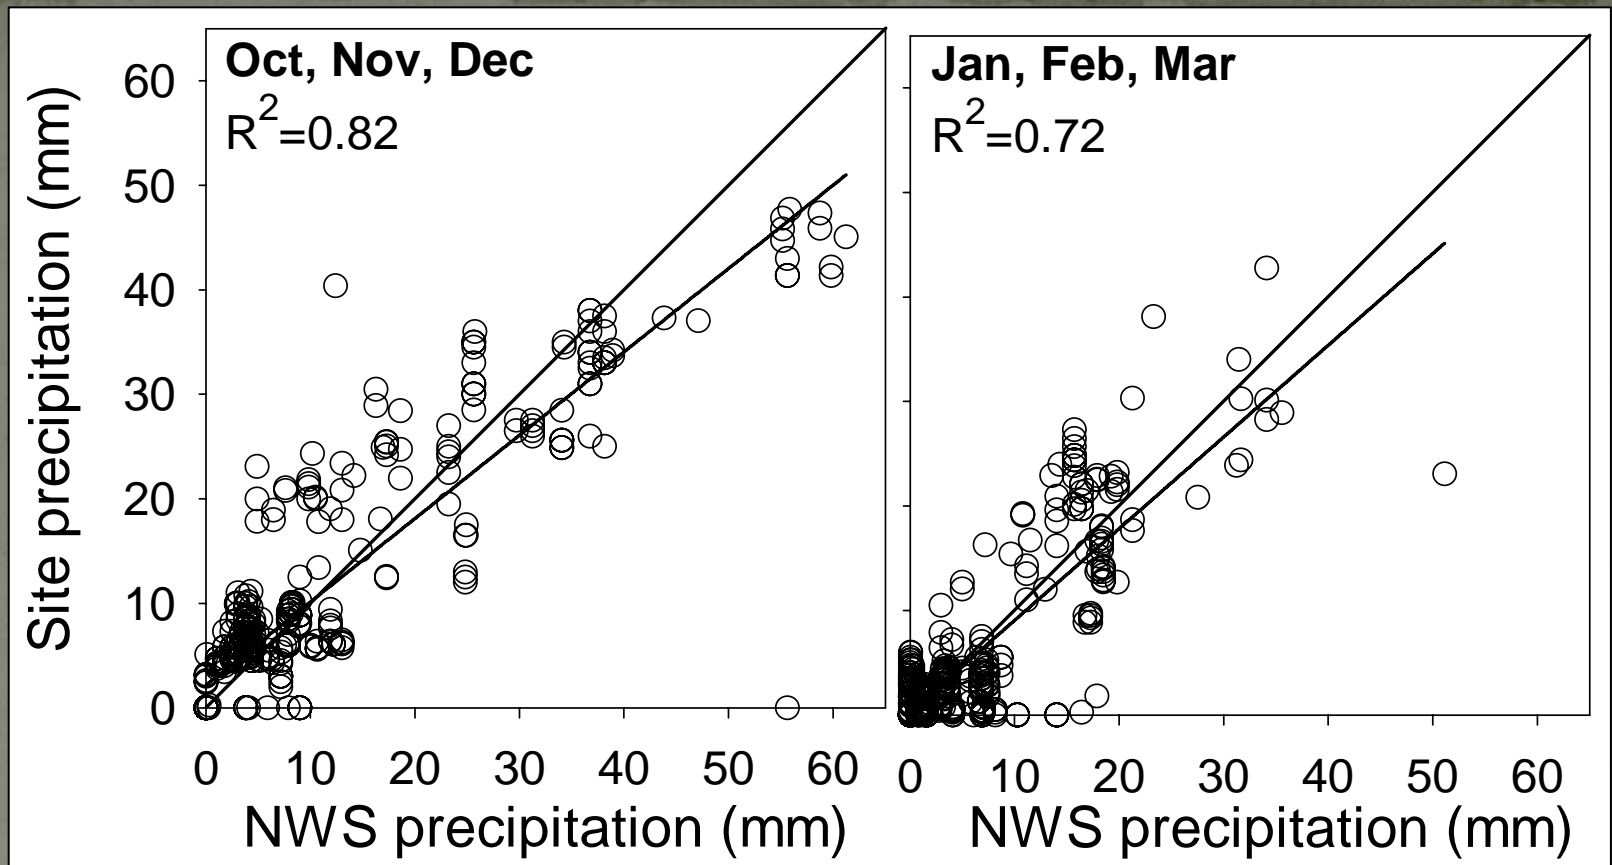

- Goal 1: Predict areas with high fine fuel production in desert tortoise habitat
- Goal 2: Determine recommended rehabilitation treatments that are appropriate for burned tortoise habitat
- Goal 3: Identify appropriate native Mojave Desert species for rehabilitating burned tortoise habitat

Project Progress

- Goal 1: Predict areas with high fine fuel production in desert tortoise habitat
 - Collect plot-level rainfall data to validate use of spatially-explicit precipitation models
 - Quantify fine fuels (peak production of exotic and native annuals) across plots
 - Correlate fine fuel production with model output of precipitation
 - Identify areas for fine fuels management based on model

- 2010 biomass collected, and weighing completed
- 2011 biomass collected; weighing in progress

- QA/QC of recent plot-level precipitation in progress
- Initial validation with available spatial models (National Weather Service vs. PRISM) for identification of areas for fuel management

Project Progress

- Goal 2: Determine recommended rehabilitation treatments that are appropriate for burned tortoise habitat
 - Monitor native and exotic plant establishment in areas treated after the wildfires
 - Evaluate the influence of climate on plant establishment in treatment areas
 - Evaluate appropriate rehabilitation treatments

Rehabilitation Treatments

Dec 2005/Nov 2006: Seeding

- Seeding with native shrubs, perennial grasses and forbs

Oct-Nov 2007: Outplanting

- Blackbrush/Mormon tea
- Soil moisture treatments

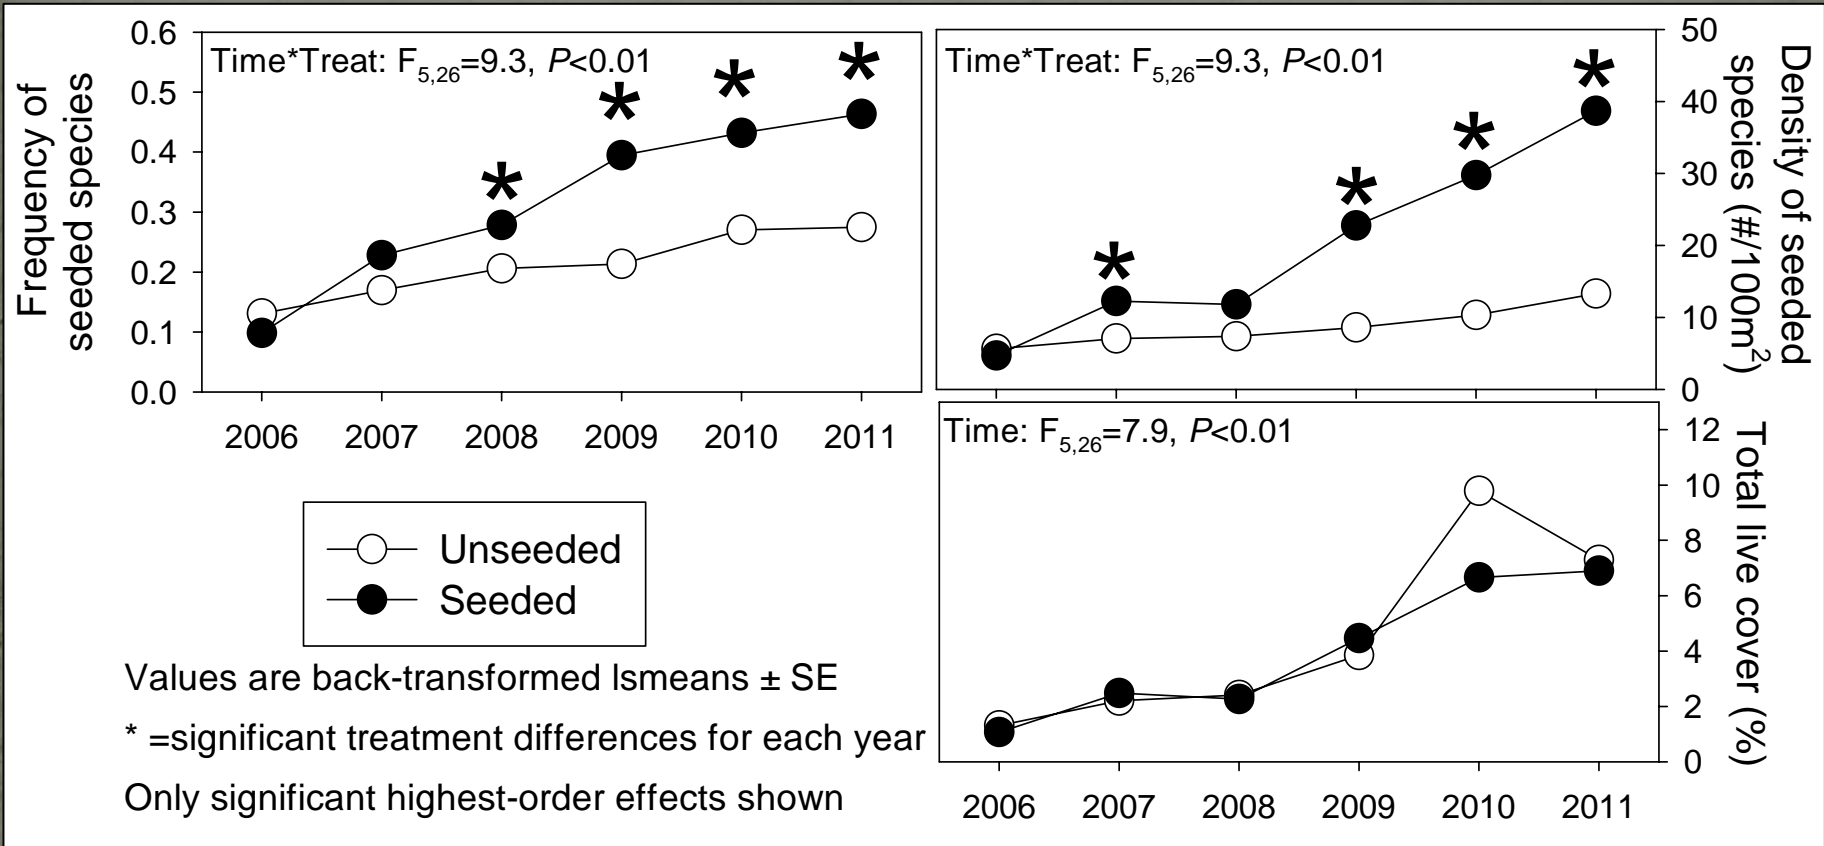

Oct 2008: Herbicides

- Pre- and post-emergent
- Hand-seeding with natives

Photos: LA DeFalco, USGS

Seeding Success

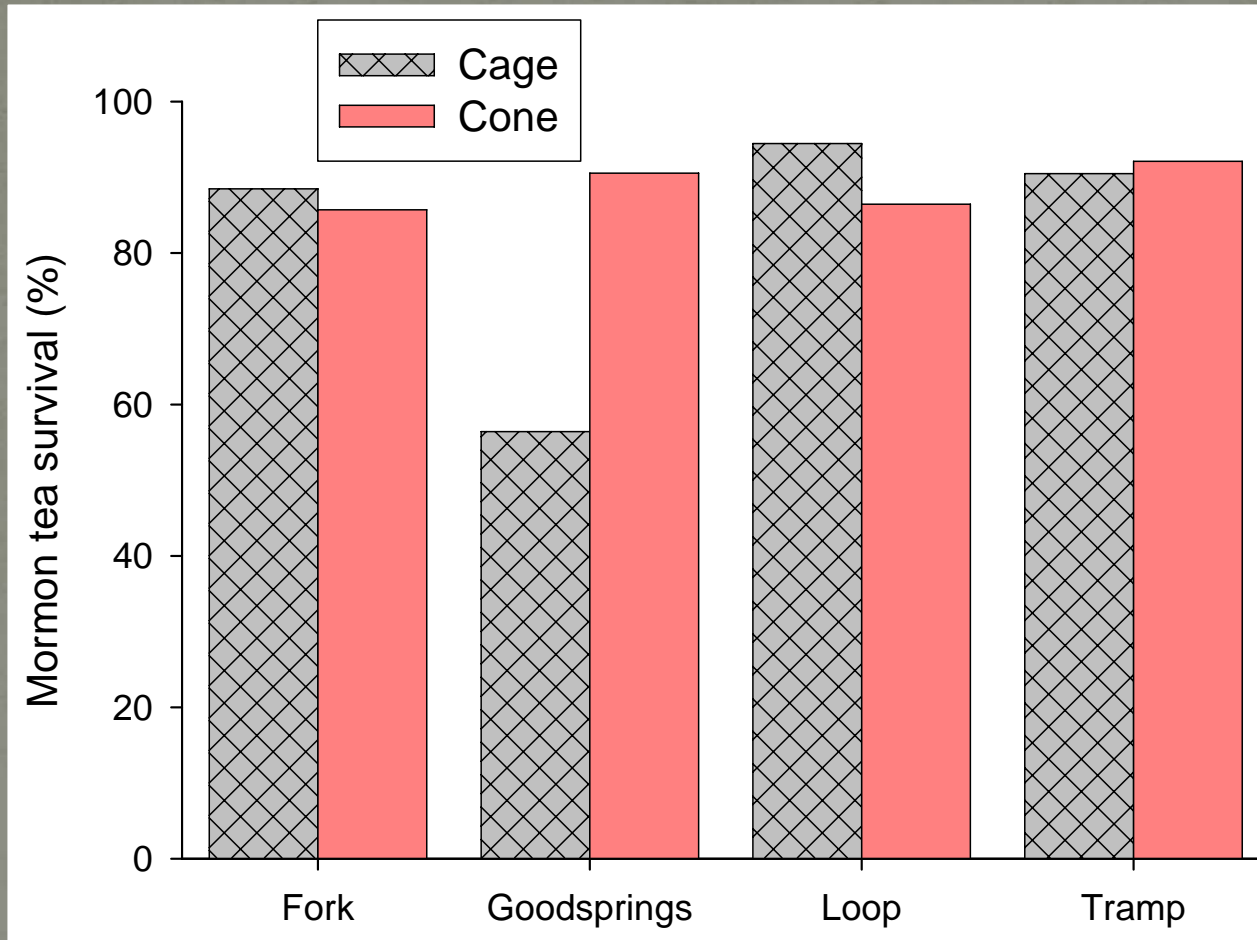

- QA/QC of plot-level precipitation in progress for evaluating climate influence on establishment and to determine suitability of seeding

Outplanting of Seedlings With Soil Moisture Manipulations

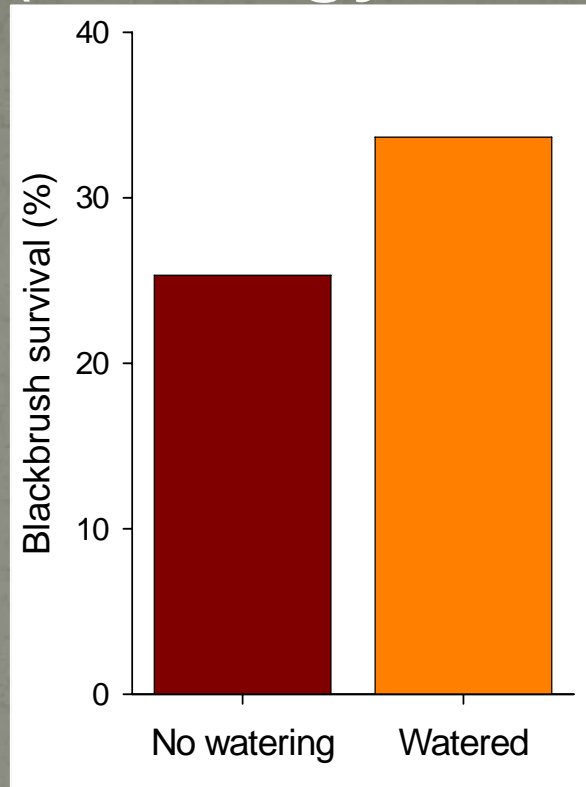

Photos: LA DeFalco, USGS

Mormon Tea (*Ephedra nevadensis*)

Blackbrush (*Coleogyne ramosissima*)

- QA/QC of recent plot-level precipitation in progress
- Updating 2011 census for final survivorship analysis and evaluation of climate influence for both species

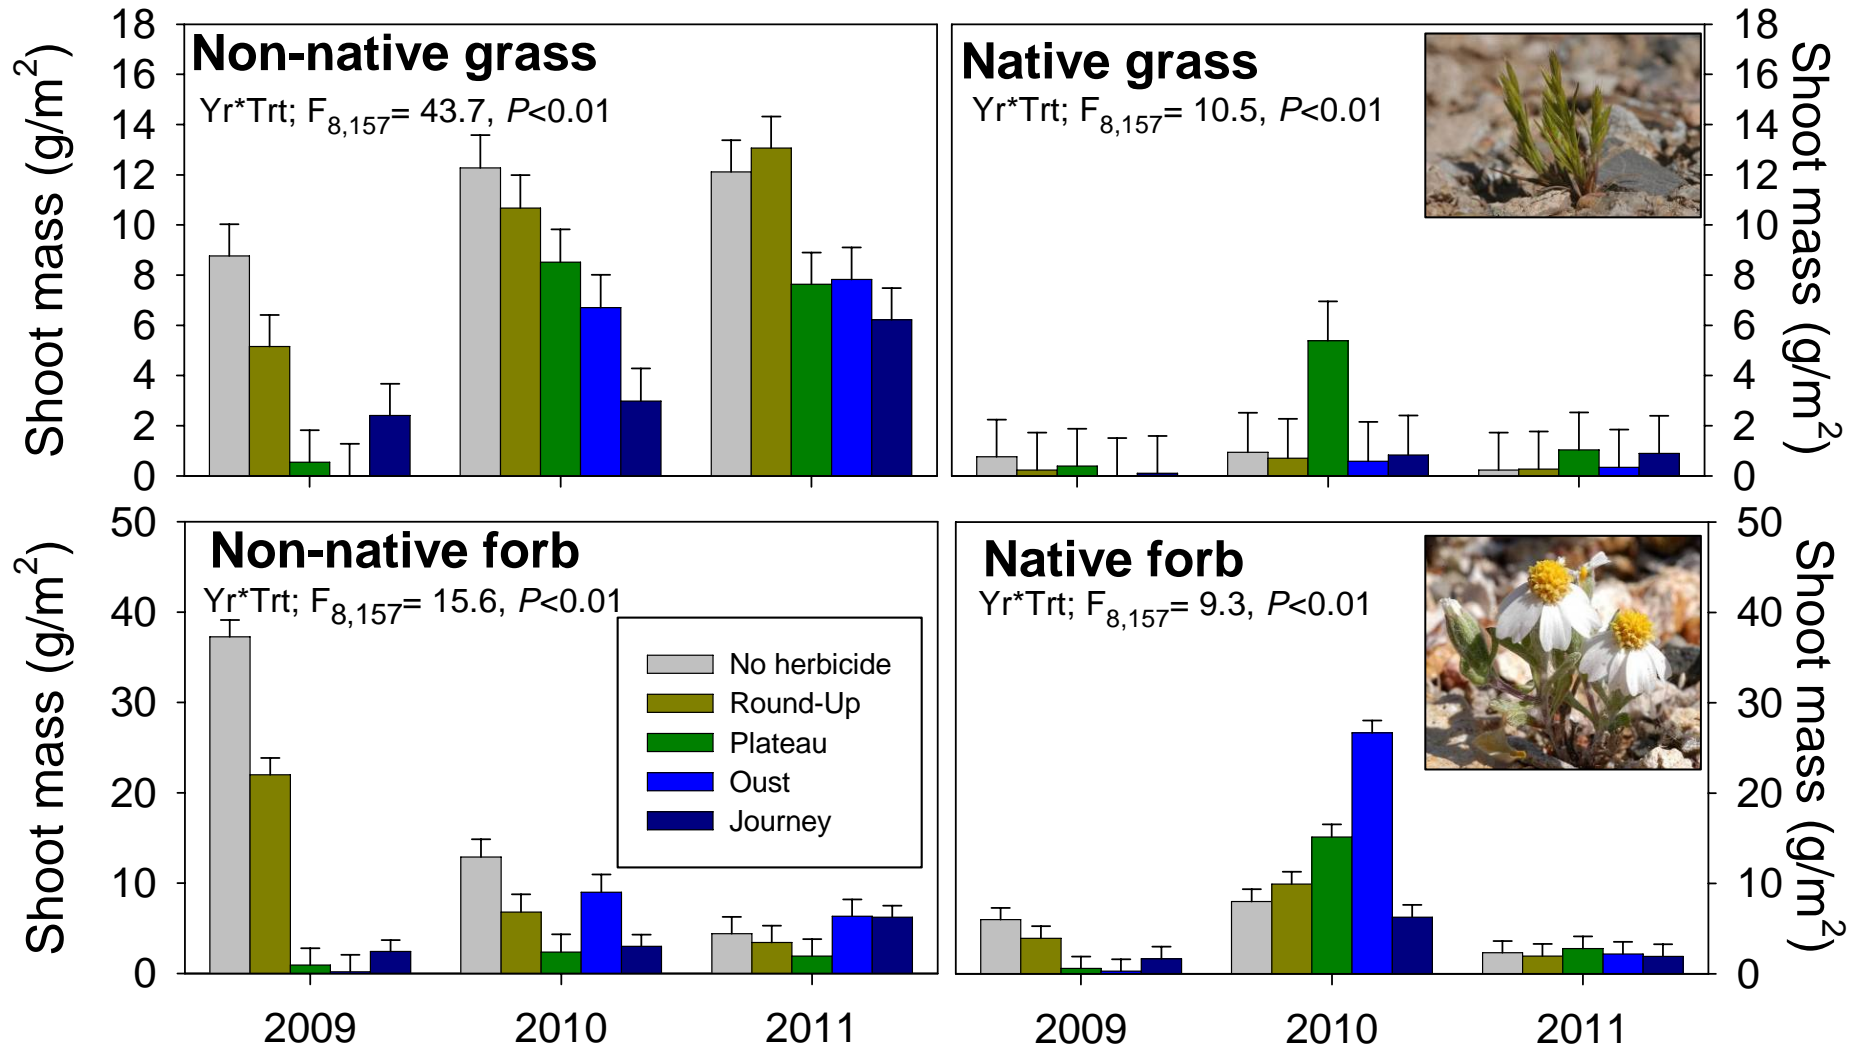

Herbicide Success

LA DeFalco, USGS

Herbicide plot in Dry Middle Fire, 2009

Annual Plant Production

Project Progress

- Goal 3: Identify appropriate native Mojave Desert species for rehabilitating burned tortoise habitat
 - Establish seed bank
 - Evaluate adequacy of selected species and seeding rates on plant establishment
 - Estimate recovery times for plant cover and community composition

Seed Bank

- Seed bank assay for 2 years following herbicide treatment is complete; analyses initiated
- Seed bank assay for seeding treatments on-going (collect final samples in Sept-Oct 2011)

Summary

- Majority of field data collection is complete (2010, 2011)
- Preliminary results are encouraging: seeding is effective based on seedling frequency and density as indicators; herbicides are effective, but may only provide narrow opportunity for reducing competition with non-natives
- Seeding treatment maintained higher seed densities in the seed bank two years after seeding and herbicide application
- In-depth analysis of data, particularly with available weather data, is expected to explain site-specific differences in rehabilitation success
